PROJECT:
Modern Residential House

Project Description:

This project is a 3D architectural visualization of a modern residential property created using Blender. The model showcases a contemporary two-story house designed with clean geometric forms, large glass panels, and an open outdoor environment. The property includes a spacious front yard, landscaped greenery, perimeter fencing, decorative lighting, a swimming pool area, and auxiliary structures that enhance the overall functionality and aesthetics of the residence.

The design follows a minimalist architectural style, emphasizing simplicity, spaciousness, and modern living. Various environmental elements such as trees, pathways, outdoor furniture, street lamps, and surrounding structures were incorporated to create a realistic residential setting. The model demonstrates fundamental and intermediate 3D modeling techniques, including object creation, scaling, texturing preparation, scene organization, and environmental design.

The project aims to provide a visual representation of a modern home concept that can be used for architectural presentations, design visualization, educational purposes, and portfolio development. Through the use of Blender's modeling tools, the project highlights the importance of spatial planning, exterior design, and realistic scene composition in architectural visualization.

Key Features

- Modern two-story residential house design
- Large glass facade and contemporary architectural elements
- Swimming pool and outdoor recreational area
- Landscaped environment with trees and decorative plants
- Perimeter walls and gated property layout
- Driveway and parking area
- Outdoor lighting fixtures
- Organized 3D scene suitable for rendering and further development

Software Used

- Blender 5.0.1

Project Objective

To design and develop a detailed 3D model of a modern residential property that demonstrates architectural visualization techniques, environmental modeling, and scene composition using Blender.

Project Output:
